

Biaslens- Bias Report

Single (MaritalStatus)

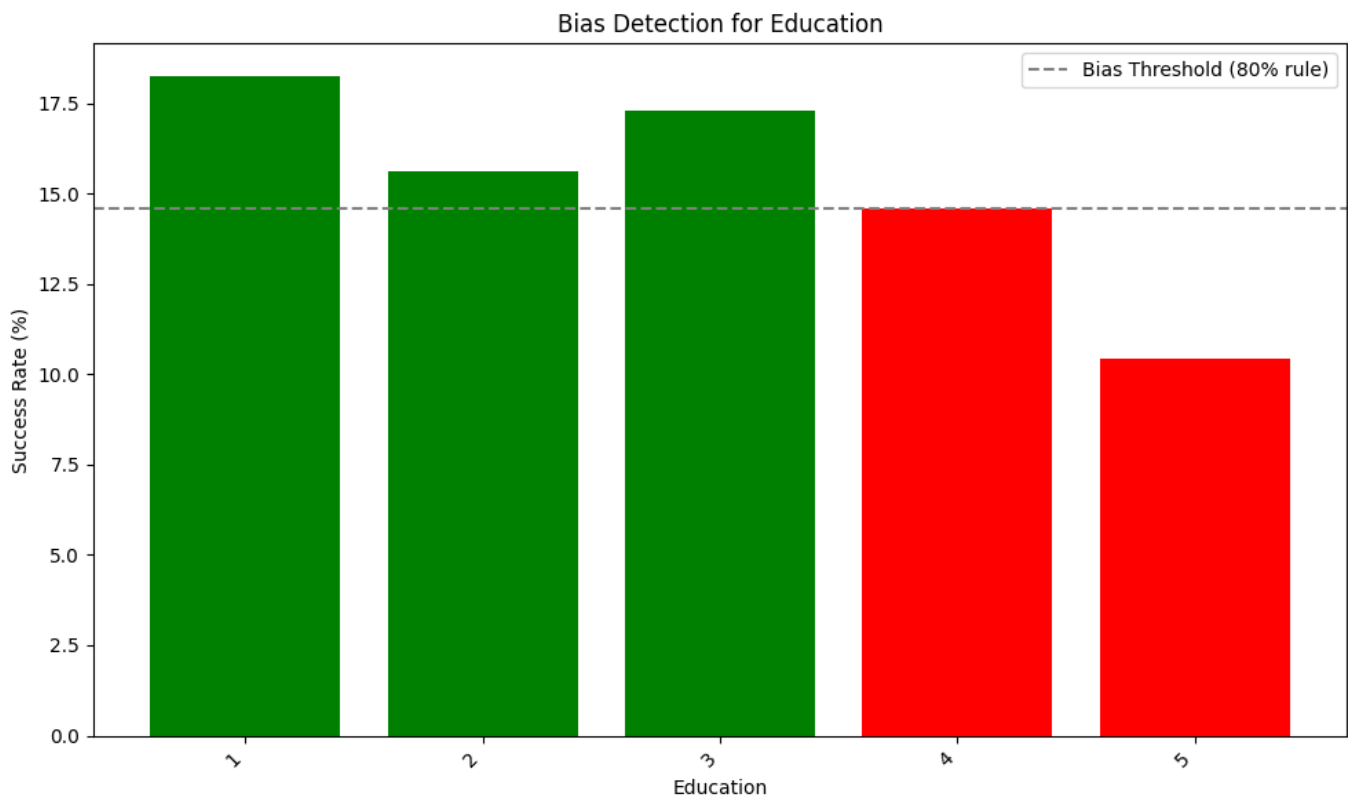

Single applicants were hired at a rate of 25.53%, which is the same as the best-performing group in this category. This means there's no unfair hiring pattern based on marital status in your data.

Married (MaritalStatus)

Married candidates are being hired at a rate of 12.48%, which is less than half the rate of the best-performing group in this category. This significant difference suggests there may be an unequal hiring process related to marital status that warrants further investigation.

Divorced (MaritalStatus)

Divorced applicants are being hired at a rate of about 10%, which is roughly 40% of the rate for the most successful marital status group. This significant gap suggests the hiring process may be treating divorced candidates differently than others, and warrants a review of your selection criteria and interview practices to ensure fairness.

2 (Education)

Good news: we found no bias issue with how candidates in this education category were treated. Group 2's success rate was about 86% of the best-performing group's rate, which is within acceptable range and doesn't raise concerns about unfair hiring practices.

1 (Education)

No bias concerns were found with how Group 1 applicants were treated in the hiring process. This group had the strongest success rate in the education category, so there's nothing to flag here.

4 (Education)

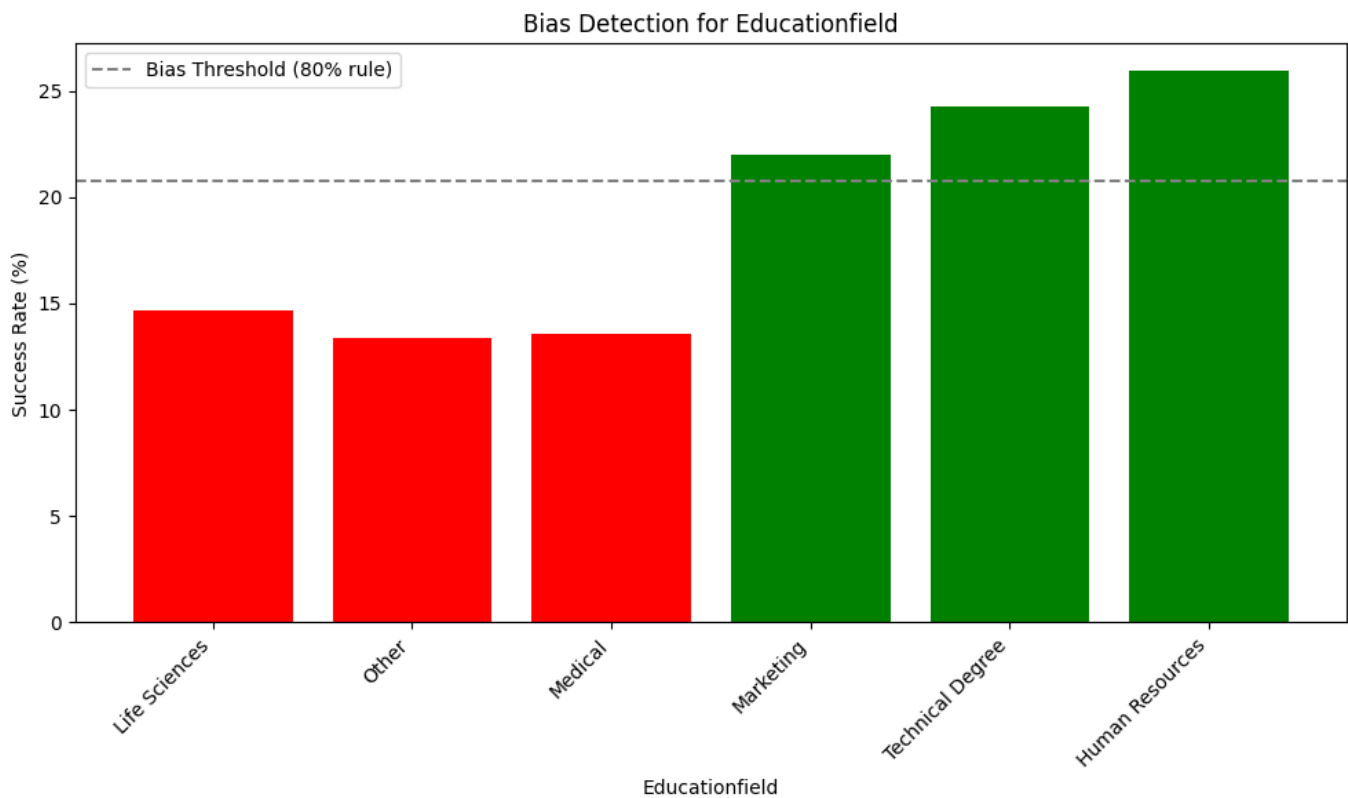

Group 4 applicants are being hired at a rate of about 14.57%, which is roughly 80% of the best-performing group's rate. This narrow gap suggests there may be a potential fairness concern in how this education category is being evaluated during hiring, and it warrants a closer review of your selection criteria and process.

3 (Education)

We looked at how often candidates with this education level were successfully hired and compared it to the group with the highest success rate. Group 3 is performing at about 95% of the best group's level, which is well above our concern threshold. There's no evidence of unfair treatment in hiring decisions for this education category.

5 (Education)

Group 5 in the education category is being hired at a significantly lower rate (about 10%) compared to the highest-performing group. This means Group 5 candidates are succeeding at less than 60% of the rate of the top group, which falls below the acceptable threshold and suggests a potential fairness concern in your hiring process for this education level.

Life Sciences (EducationField)

Candidates with a Life Sciences background are being hired at a rate of about 14.7%, which is significantly lower than the best-performing education field group. Specifically, Life Sciences candidates are hired at less than 57% of the rate of the highest-performing group, which falls below our fairness threshold. This pattern suggests we should review our hiring criteria to ensure they aren't inadvertently disadvantaging Life Sciences graduates.

Other (EducationField)

Candidates from the "Other" education field background are being hired at a much lower rate (13.41%) compared to the top-performing education field group. Specifically, they're hired at less than half the rate of the best-performing group, which suggests potential bias in how candidates with different educational backgrounds are being evaluated. Your team should review the hiring criteria for this position to ensure all educational backgrounds are being assessed fairly.

Medical (EducationField)

Candidates with a Medical education background are being hired at a rate of 13.58%, which is less than half the rate of the highest-performing education group. This significant gap suggests the hiring process may be treating Medical candidates differently than others and warrants a closer review of your job requirements and selection criteria to understand why this group is succeeding at a much lower rate.

Marketing (EducationField)

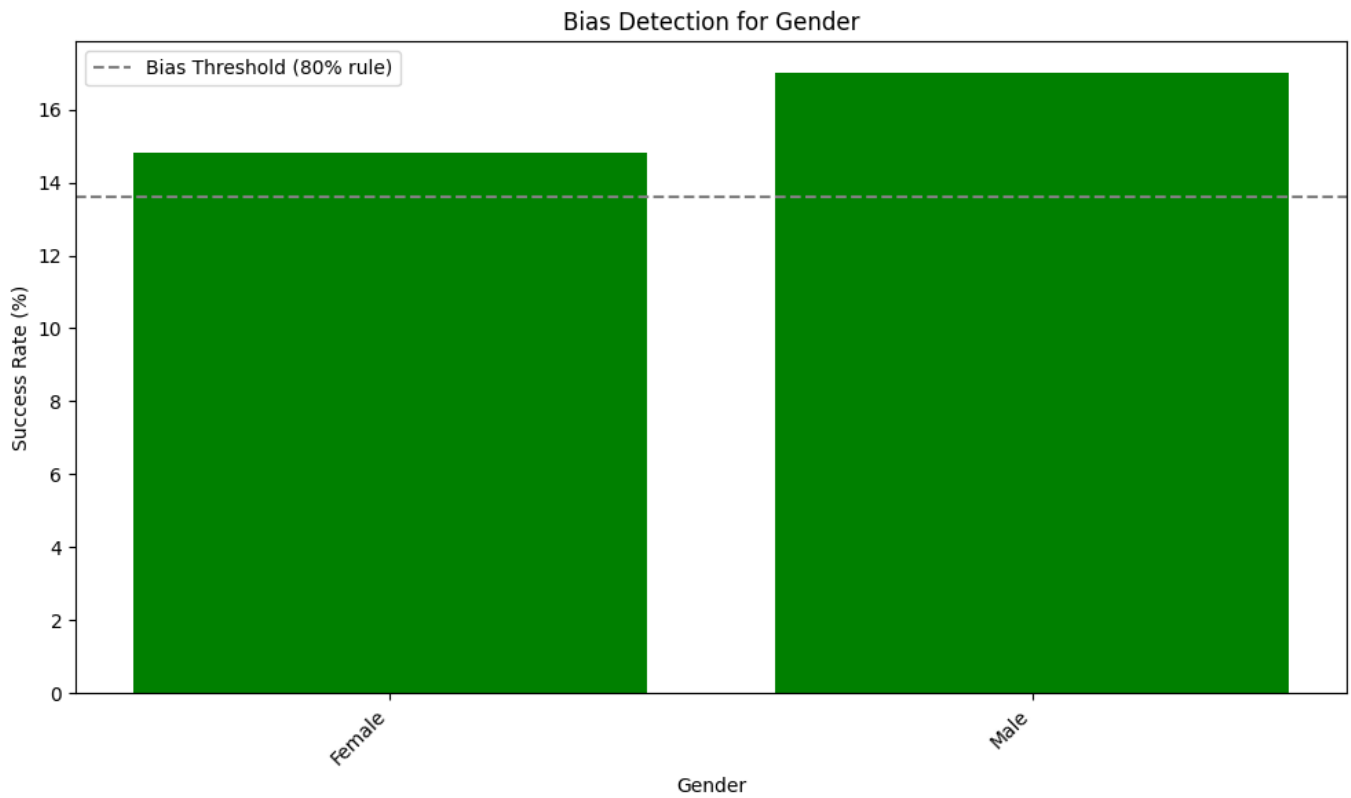

Applicants with a Marketing education background were hired at a rate of 22.01%, which is about 85% of the rate for the best-performing education field. Since this is above the 80% threshold, there's no indication of unfair treatment based on educational background in your hiring process.

Technical Degree (EducationField)

Candidates with technical degrees are being hired at a rate of about 24%, which is 93.51% of the success rate for the best-performing education group. Since this difference is small enough to be explained by normal variation, there's no sign of unfair treatment against this group in your hiring process.

Human Resources (EducationField)

Applicants with a Human Resources educational background had a 25.93% success rate in hiring, which was the best performance among all education fields compared. Since this group performed as well as or better than every other education field, there's no evidence of unfair treatment based on educational background in this hiring process.

Female (Gender)

Women have a 14.8% success rate in hiring, which is 87% of the rate for the best-performing group. Since this ratio is above the 80% threshold, there's no statistical evidence of gender bias in this particular hiring process.

Male (Gender)

Males had a 17.01% success rate in hiring and performed as well as any other group in this analysis. There's no evidence of unfair treatment based on gender in this particular hiring outcome.
